Answer: B. Production of energy through cellular respiration

Constructed Response Sample Question

Explain how natural selection can lead to a change in the frequency of a trait within a population over time. Use an example to support your explanation.

Sample Answer: Natural selection occurs when individuals with advantageous traits are more likely to survive and reproduce. Over time, these traits become more common in the population. For example, in peppered moths, darker-colored moths became more prevalent during the Industrial Revolution because they were better camouflaged against soot-darkened trees, reducing predation.

Data-Based Question

Given a graph showing the population size of a species over ten years, identify any trends and suggest possible environmental factors that could influence these changes.

Students would analyze the graph for trends such as growth, decline, or stability and relate these to factors like climate change, availability of resources, predation, or human activities.
