Sample MCQs with Answers and Explanations

To illustrate the utility of these MCQ resources, below are some sample questions spanning different topics.

Question 1: Coronary Artery Bypass Grafting (CABG)

Which of the following grafts is most commonly used for CABG?

A) Saphenous vein

B) Internal mammary artery

C) Radial artery

D) Femoral artery

Correct Answer: B) Internal mammary artery

Explanation:

The internal mammary (thoracic) artery is preferred due to its superior long-term patency rates and resistance to atherosclerosis. While saphenous veins are commonly used, they have lower long-term success. Radial arteries are also used but less frequently as a primary graft. Femoral arteries are typically not used as grafts in coronary bypass surgery.

Question 2: Valve Replacement

Which type of prosthetic valve is associated with the highest risk of thromboembolism if anticoagulation is not maintained?

A) Mechanical valve

B) Bioprosthetic valve

C) Homograft valve

D) Autograft valve

Correct Answer: A) Mechanical valve

Explanation:

Mechanical valves are durable but require lifelong anticoagulation due to their thrombogenic nature. Without proper anticoagulation, they pose a high risk of thromboembolism. Bioprosthetic valves have lower thrombogenicity but tend to degenerate faster.

Question 3: Congenital Heart Disease

In which congenital defect is a "hole in the atrial septum" most characteristic?

A) Ventricular septal defect

B) Atrial septal defect

C) Patent ductus arteriosus

D) Tetralogy of Fallot

Correct Answer: B) Atrial septal defect

Explanation:

An atrial septal defect (ASD) involves an abnormal opening in the atrial septum, leading to left-to-right shunting of blood. VSD involves a ventricular septal opening, PDA involves abnormal ductus arteriosus, and Tetralogy of Fallot is characterized by multiple defects including VSD and pulmonary stenosis.

Sample Questions and Answers from Form 2

Question 1: Preoperative Evaluation

A 65-year-old man with hypertension and diabetes is scheduled for elective cholecystectomy. His labs show elevated blood glucose. What is the most appropriate next step?

- A) Proceed with surgery without further testing
- B) Delay surgery until blood glucose is controlled
- C) Administer insulin only on the day of surgery
- D) Perform an ECG to evaluate cardiac risk

Answer: B) Delay surgery until blood glucose is controlled

Rationale:

Uncontrolled diabetes increases the risk of postoperative infections and poor wound healing. Optimal glycemic control reduces these risks. While elective surgeries can often proceed safely after stabilization, delaying until blood glucose levels are better controlled is prudent. Performing additional cardiac evaluation (like ECG) might be necessary if other risk factors are present but is not the immediate priority in this scenario.

Question 2: Trauma Management

A 30-year-old woman is brought to the ER after a motor vehicle accident. She is hypotensive and tachycardic. On examination, she has distended neck veins and muffled heart sounds. What is the

most likely diagnosis?

- A) Tension pneumothorax
- B) Cardiac tamponade
- C) Massive hemothorax
- D) Spinal cord injury

Answer: B) Cardiac tamponade

Rationale:

The classic Beck's triad (hypotension, distended neck veins, muffled heart sounds) indicates cardiac tamponade, which occurs when blood accumulates in the pericardial sac, impairing cardiac filling. Immediate diagnosis and intervention, such as pericardiocentesis, are critical to prevent cardiovascular collapse.

Question 3: Surgical Infection Prevention

Which of the following measures most effectively reduces postoperative wound infections?

- A) Administering prophylactic antibiotics within 1 hour before incision
- B) Removing surgical drains early
- C) Using sterile gloves only
- D) Ensuring patient fasting for at least 8 hours

Answer: A) Administering prophylactic antibiotics within 1 hour before incision

Rationale:

Timely prophylactic antibiotics significantly reduce the risk of surgical site infections. The optimal window is within 1 hour before incision. Proper skin antisepsis, sterile technique, and perioperative management also contribute but are secondary to timely antibiotic administration.
