Sample Questions and Memorandum Answers

Below are examples of typical questions from the April 2014 assignment along with their detailed solutions as per the memorandum.

Question 1: Describe the process of photosynthesis, including the main stages and their significance.

Memorandum Answer:

Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose molecules. The process occurs mainly in the chloroplasts of plant cells and involves two main stages:

- Light-dependent reactions:

- Occur in the thylakoid membranes.
- Chlorophyll absorbs light energy, exciting electrons.
- Water molecules are split (photolysis), releasing oxygen, protons, and electrons.
- Energy from excited electrons is used to produce ATP and NADPH.

- Light-independent reactions (Calvin Cycle):

- Occur in the stroma.
- ATP and NADPH from the light-dependent stage are used to convert carbon dioxide into glucose.
- Carbon fixation occurs when CO₂ combines with ribulose biphosphate (RuBP), catalyzed by the enzyme Rubisco.

Significance:

- Produces oxygen necessary for respiration.
- Forms the base of most food chains.
- Regulates atmospheric CO₂ levels.

Question 2: Explain Mendel's law of independent assortment with an example.

Memorandum Answer:

Mendel's law of independent assortment states that alleles for different genes segregate independently of one another during gamete formation. This results in the inheritance of one trait not influencing the inheritance of another.

Example:

Consider a dihybrid cross involving seed shape (Round R, Wrinkled r) and seed color (Yellow Y, Green y):

- Parent genotype: RrYy (heterozygous for both traits)
- The gametes produced can be: RY, Ry, rY, ry

According to the law, these combinations are formed independently, leading to a 9:3:3:1 phenotypic ratio in the F₂ generation.

Conclusion:

This law explains the variety of phenotypes observed and is fundamental in understanding genetic inheritance patterns.
